

Issue (UTSA): UTSA should increase hands-on, project-based learning in computer science courses.

Toulmin Argument (standard argumentative claim)

Claim: UTSA should increase hands-on, project-based learning in computer science courses.

1. Employers value practical experience, and project-based courses better prepare students for internships and jobs.
2. Hands-on projects help students understand complex concepts better than exams alone.
3. Many peer universities already use project-based learning and see stronger student outcomes.

Rogerian Argument (same claim, but accepting the other side)

I understand that some professors prefer traditional lecture-and-exam formats because they are easier to standardize and assess fairly. That concern makes sense, especially for large classes. However, both students and faculty want graduates to be well-prepared for real-world problem solving. A reasonable compromise is keeping core theory exams while adding smaller, structured projects, allowing students to gain practical skills without losing academic rigor.
